### Emerging 2D Materials and Their Van Der Waals ... - MDPI

Since graphene became available by a scotch tape technique, a vast class of two-dimensional (2D) van der Waals (vdW) layered materials has been researched intensively. What is more intriguing is that the well-known physics and chemistry of three-dimensional (3D) bulk materials are often irrelevant, revealing exotic phenomena in 2D vdW materials.

Held together by van der Waals forces (the same forces that hold layered materials together), such heterostructures allow a far greater number of combinations than any traditional growth method. As the family of 2D crystals is expanding day by day, so too is the complexity of the heterostructures that could be created with atomic precision.

A two-dimensional semiconductor (also known as 2D semiconductor) is a type of natural semiconductor with thicknesses on the atomic scale. The rising research attention towards 2D semiconductors started with a discovery by Geim and Novoselov et al. in 2004, when they reported a new semiconducting material graphene, a flat monolayer of carbon atoms arranged in a 2D honeycomb lattice.

### 2D materials and van der Waals heterostructures

Two-dimensional (2D) materials exhibit a number of improved mechanical, optical, electronic properties compared to their bulk counterparts. The absence of dangling bonds in the cleaved surfaces of these materials allows combining different 2D materials into van der Waals heterostructures to fabricate p-n junctions, photodetectors, 2D-2D ohmic contacts that show unexpected performances. These ...

The interactions in van der Waals stacked 2D heterostructures are weak, but their electron orbitals still extend out of the plane and influence the electronic properties in the adjacent 2D layers [43-91]. Thus, the electronic properties of 2D materials can be engineered by van der Waals stacking. 2.1. 2D materials on hBN

More recently, developments in the exfoliation of van der Waals (vdW) layered materials have made atomically thin 2D superconductors more readily accessible (e.g., ML-TaS 2) (18-21). Subsequent studies have revealed a form of superconductivity characterized by strong Ising spin-orbit coupling equivalent to applying magnetic fields on the order of 100 T ( 19 - 21 ).
