I am using C1 and C2 to nail the bandwidth in the medium wave (MW) band, where C2 behaves more like an RF bypass and shorts any unwanted frequencies to ground. I am also controlling the gain to use the linear part of the transistor characteristic, which is where the Darlington transistor amplifies radio frequency (RF) signals most efficiently.

It can use general purpose transistors, and in this example there are 3 BC109C transistors. The schematic and BOM show a 200 $\mu$ H inductor and a trimmer capacitor 150-500pF, though these parts can be salvaged from an old AM radio, to preserve the directional nature of a tuning coil, and an adjustment knob (plate capacitor) that work well for radio reception.
