Crossbleed Engine Start Procedures on Airbus A320

The MANUAL ENGINE START procedure is a "read and do" procedure. Refer to FCOM/99 Duref cible before starting a manual engine start. The FADEC has limited control over the manual start process. It ensures that the engine start valve closes at 50 % N2. It monitors engine parameters, and generates an associated warning when necessary.

In that case you could start one engine manually, then the other in auto start as the engine bleed in those circumstances generally provides sufficient bleed pressure for a cross bleed start. Generally the Airbus, both A320 family and A330 in my experience are very reliable, and forgiving, of just about all scenarios, but occasionally you get the odd problem.

(Again, A320, only two engines.) (This is an A380, showing N3) Once N3 is spun up to 50%, over the interphone, command the engineer to manually close the start valve. e) Monitor the engine parameters closely until all are properly stable. f) After the engineer has closed up the engine and vacated the area, start the other engines, if one was shut down per step 3. Over the cabin interphone, notify the cabin crew that the procedure is complete. (so they can resume using the interphone if needed.

A320 Manual Engine Start

MANUAL STARTS - Manual starts are only performed on the ground. During start, the FADEC controls the igniters (A and B), the high pressure fuel valve, and the closure of the start valve. The FADEC monitors N1, N2, and EGT when N2 is below 50%. ECAM start fault detection is available, however, automatic abort and crank capabilities are not available.
