Mud Motors. While these can be used for both directional and vertical drilling, high-powered mud motors have advanced horizontal drilling by making it easier for the drill bit to change directions. These work by pushing drilling fluid, or mud, through the positive displacement motor, which results in continuous rotation of the bit.

The gas wetness of the mud gas in combination with petrophysical logs can provide information about the hydrocarbon fluid type (gas vs. oil) or the liquids content (e.g. CGR or GOR).

However, the extent to which mud gas components permeate into the mud is influenced by operational factors such as rate of progress (ROP) and mud weight.
