The goals of core analysis today remain the same as those identified 21 years ago: to "reduce uncertainty in reservoir evaluation" and finding ways to obtain this information faster. In the past, the focus was on developing experimental protocols that could shorten the experimental time, such as the continuous-injection-resistivity protocol.

In light of technological advances in construction methods, analytical tools and monitoring instrumentation, new different evaluation criteria are being proposed in addition to different in-situ load test methods. Some criteria may be more appropriate than others based on the expected damage and failure mechanisms of the structure being considered.
