Terrain tools facilitate the use of large point collections, such as lidar, that would normally pose a problem to databases. Scalability is achieved primarily through two means: terrain pyramids and the multipoint shape type. Terrain pyramiding is used to improve performance. It does so by providing a scale-dependent means of data reduction.

Verifying system requirements

Event Throughput / System Performance When considering system scalability and the GeoEvent extension, most folks are thinking about the number of event messages they need to process each second. A simple GeoEvent service with a single TCP/Text input sending data out to a TCP/Text output can process thousands of events per second.
