Arithmetic Sequence Practice Problems - ChillMath

There are many problems we can solve if we keep in mind that the n th term of an arithmetic sequence can be written in the following way: $a_n = a_1 + (n - 1)d$ Where a_1 is the first term, and d is the common difference. For example, if we are told that the first two terms add to 10, the fifth term is 14, and that the common difference is 2 less than the first term we can take this equation:

Find the terms a_2 , a_5 and a_7 of the arithmetic sequence if you know : Find the sum s_5 , s_{12} and s_{20} of the arithmetic sequence if you know : We put a few numbers between numbers 12 and 48 so that all the numbers together now form the increasing finite arithmetic sequence. The sum of all entered numbers is 330.

Arithmetic Sequence Problems And Solutions

Arithmetic sequences are used throughout mathematics and applied to engineering, sciences, computer sciences, biology and finance problems. A set of problems and exercises involving arithmetic sequences, along with detailed solutions and answers, are presented.

Arithmetic Progressions: Problems with Solutions

Because the sequences are arithmetic progressions, we can use the formula to find sum of 'n' terms of an arithmetic series. $S_n = \frac{n}{2}(2a + (n-1)d)$ Substitute $n = 12$, $a = 1$ and $d = 2$. $S_{12} = \frac{12}{2}(2(1) + (12-1)2) = 12(13) = 156$. Therefore the clock will strike 156 times in a day. Problem 4

Arithmetic Sequence Problems | Superprof

Sequences whose rule is the addition of a constant are called arithmetic sequences, similar to geometric sequences that follow a rule of multiplication. Homework problems on arithmetic sequences often ask us to find the n th term of a sequence using a formula. Arithmetic sequences are important to understanding arithmetic series.

Arithmetic & Geometric Sequences | Purplemath

Arithmetic Sequence Problem. Solution. Find the general formula for the n th term, and then find the 18th term a_{18} of the sequence: 4, 7, 10, 13, ... We can see that the second term - the first = the third term - the second = 3, so this is the common difference.

Gauss's Problem and Arithmetic Series - Cool Math

The first thing I have to do is figure out which type of sequence this is: arithmetic or geometric. I quickly see that the differences don't match; for instance, the difference of the second and first term is $2 - 1 = 1$, but the difference of the third and second terms is $4 - 2 = 2$. So it isn't an arithmetic sequence.

Arithmetic Progressions Problems with Solutions- Hitbullseye

Gauss was about 9 years old -- already a super genius (much like Wile E. Coyote.) His teacher hated math and hated Gauss (because he was so smart). As usual, the teacher walked into the class and gave them a horribly tedious arithmetic problem. They were to work on it and not bother him. Here was the day's problem: Add the integers from 1 to 100.
