In both types of transformer core design, the magnetic flux linking the primary and secondary windings travels entirely within the core with no loss of magnetic flux through air. In the core type transformer construction, one half of each winding is wrapped around each leg (or limb) of the transformers magnetic circuit as shown above.

accordingly. Consequently auto-transformer can be design with less active material (i.e. copper and steel) in comparison with a standard two-winding power transformer design for same rated voltages and rated through power. It can be shown that this reduction factor can be calculated for the example auto-transformer by using the following equation:

TheJ&P Transformer Book - My Protection Guide

An autotransformer is an electrical transformer with only one winding. The "auto" (Greek for "self") prefix refers to the single coil acting alone, not to any kind of automatic mechanism. In an autotransformer, portions of the same winding act as both the primary winding and secondary winding sides of the transformer. In contrast, an ordinary transformer has separate primary and secondary ...

Purpose of Transformer Core In an electrical power transformer, there are primary, secondary and sometimes also tertiary windings. The performance of a transformer mainly depends upon the flux linkages between these windings. For efficient flux linking between these windings, one low reluctance magnetic path common to all windings should be..

Differential Protection Schemes for Auto- Transformers

If it's running from an oscillator then the frequency is fixed therefore you can tune the auto-transformer so that there is minimal reactive load to the oscillator. A 33pF capacitor and a 1uH coil are resonant at about 28MHz but do some tweaking so that the unloaded inductor and capacitor are near enough fully resonant at 28 MHz.

Calculations for Design Parameters of Transformer ...

The construction of a variable autotransformer, or variac, is the same as for the fixed type. A single primary winding wrapped around a laminated magnetic core is used as in the auto transformer but instead of being fixed at some predetermined tapping point, the secondary voltage is tapped through a carbon brush.
