### An Overview of Automatic Guided Vehicles - Technical Articles

An automated guided vehicle (AGV) consists of a mobile robot used for transportation and automatic material handling, for example, for finished goods, raw materials, and products in process. The design and operation of AGV systems are highly complex due to high levels of randomness and the large number of variables involved.

### Advantages & Disadvantages of Automated Guided Vehicles (AGVs)

An automated guided vehicle or automatic guided vehicle (AGV) is a portable robot that follows along marked long lines or wires on the floor, or uses radio waves, vision cameras, magnets, or lasers for navigation. They are most often used in industrial applications to transport heavy materials around a large industrial building, such as a factory or warehouse.

### Automated guided vehicle - Wikipedia

AGVs, Automated Guided Vehicle, play a leading role in the field of warehouses "4.0". They move, load, unload, collect material and much more, carrying out these tasks with a strength and precision that human beings could not guarantee, and they do all this without having to be guided or controlled by a person and, if desired, without interruption at night.
