Basic Theory of Metallic Corrosion - Allied Corrosion ...

Coatings and Cathodic Protection – Coatings are the primary line of defense against corrosion. – Holidays are a major cause for corrosion failure. – Cathodic protection is an essential supplement to coated pipe. – Federal and state regulations require cathodic protection on all pipelines and tanks that contain hazardous and other regulated substances.

Basic Corrosion and Cathodic Protection

The basic principle of CP is simple. A metal dissolution is reduced through the application of a cathodic current. Cathodic protection is often applied to coated structures, with the coating providing the primary form of corrosion protection. The CP current requirements tend to be excessive for uncoated systems.

Basic Principles of Cathodic Protection - Week 2: Cathodic ...

There are two basic types of cathodic protection systems: galvanic and impressed current. Galvanic Cathodic Protection Galvanic corrosion is an electrical-chemical process where one metal is more susceptible to corrosion than another when both metals are linked electrically.

Cathodic Protection Basic Theory of Metallic Corrosion Basic Theory of Metallic Corrosion In a galvanic reaction, the electrical potential (voltage) difference between the anode and cathode causes the corrosion current to flow.

Corrosionpedia - What is Anodic Protection? - Definition ...

Cathodic protection is one of the most effective methods for preventing corrosion on a metal surface. Cathodic protection is commonly used to protect numerous structures against corrosion, such as ships, offshore floaters, subsea equipment, harbours, pipelines, tanks; basically all submerged or buried metal structures.

An Introduction to Cathodic Protection Principles

This week, will discuss how cathodic protection works and how it can be applied in practice to protect metallic structures.Firstly, we ' ll discuss some of the basic principles behind cathodic protection, and we will see how some of the concepts you have learned in the other units are applied in a cathodic protection scenario.Subsequently, we ' ll discuss some aspects related to the design of ...

Chapter 4 Fundamentals of Cathodic Protection

Corrosion control systems which relocate these oxidation reactions, by making the protected structure a cathode in a larger corrosion cell, is called a "cathodic" protection system." The cathodic protection anodes are installed to

Cathodic Protection Equipment and Measurement

Anodic protection is the method or technique adopted to reduce the corrosion of the surface of a metal by connecting it as an anode with respect to an inert cathode in the cell formed due to an electrochemical reaction in the corrosive environment, and ensuring that the electrode potential is controlled to keep the metal in a passive state.

Cathodic protection explained - Cathwell

Cathodic protection prevents corrosion by converting all of the anodic (active) sites on the metal surface to cathodic (passive) sites by supplying electrical current (or free electrons) from an alternate source. Usually this takes the form of galvanic anodes, which are more active than steel.

Introduction to Cathodic Protection | matcor.com

Cathodic protection has been a proven technology for prevention of corrosion on buried pipelines for nearly a century. This presentation will cover the proper selection, installation and use of flange and casing isolators in the prevention of corrosion.

4.18 Principles of Cathodic Protection

Cathodic protection (CP) is a technique used to control the corrosion of a metal surface by making it the cathode of an electrochemical cell. A simple method of protection connects the metal to be protected to a more easily corroded "sacrificial metal" to act as the anode. The sacrificial metal then corrodes instead of the protected metal.
