Primary ciliary dyskinesia (PCD) results from mutations in over 30 different genes. These genes provide instructions for making proteins that form the inner structure of cilia and produce the force needed for cilia to bend. Proper movement of cilia is necessary for the normal functioning of many organs and tissues.The movement of cilia also helps organ placement during embryonic development.

Wagner syndrome is a hereditary eye disorder that leads to progressive vision loss. It is characterized by changes to the thick, clear gel that fills the eyeball (the vitreous), in which it becomes thin and watery and appears empty. The first signs and symptoms usually appear in childhood, but onset may be as early as age 2.
