Cell Division: A Review Cells can reproduce either: asexually via mitosis or ; sexually via meiosis. In mitosis, asexual cell division, one diploid (2n) parent cell gives rise to two diploid daughter cells that are genetically identical to the original cell and to each other.. Where does mitosis occur? In multicellular organisms, somatic (body) cells undergo mitosis to provide new cells for ...

Mitosis and Meiosis: A Review
Types of Cell Division. There are two distinct types of cell division out of which the first one is vegetative division, wherein each daughter cell duplicates the parent cell called mitosis. The second one is meiosis, which divides into four haploid daughter cells. Mitosis: The process cells use to make exact replicas of themselves. Mitosis is ...

simple and effective way of coordinating cell growth and division (Figure 2B). By definition, size thresholds enforce a minimal cell size. It has been observed in many cell types that smaller cells delay cell cycle pro-gression until they have grown to a certain size [11,31,50,52–57]. Conversely, size thresholds correct

The cell cycle. In eukaryotic cells, the cell cycle is divided into two major phases: interphase and mitosis (or the mitotic (M) phase). Interphase is the longest part of the cell cycle. This is when the cell grows and copies its DNA before moving into mitosis. During mitosis, chromosomes will align, separate, and move into new daughter cells.
