The "psychic" was correct in 50 cases. To determine if he has ESP, we test the hypotheses $H_0: p = .2$, $H_a: p > .2$, where p represents the true proportions of cards for which the psychic would correctly identify the symbol in the long run. Assume the conditions for inference are met. The p -value of this test is

Two Proportions SPSS doesn't do this test. There are plenty of online calculators that will. Generally you only have to input the proportion (or number) of successes and the sample size for each sample and hit a calculate button somewhere. It will usually give you a test statistic (z) and the P-value.
