Circular Waveguide Tutorial Circular waveguides Introduction Waveguides can be simply described as metal pipes. Depending on their cross section there are rectangular waveguides (described in separate tutorial) and circular waveguides, which cross section is simply a circle. This tutorial is dedicated to basic properties of circular waveguides.

Introduction to Waveguides. Waveguides are basically a device ("a guide") for transporting electromagnetic energy from one region to another. Typically, waveguides are hollow metal tubes (often rectangular or circular in cross section). They are capable of directing power precisely to where it is needed, can handle large amounts of power and function as a high-pass filter.

Circular waveguide. Figure depicts Circular waveguide. Cutoff Frequency equation for circular waveguide f_c is defined below , $f_c = \frac{1.8412 \cdot c}{2 \cdot \pi \cdot a}$ Where, c is the speed of light within waveguide and a is the radius of the circular cross section. Dominant mode in rectangular waveguide is TE10 and in circular waveguide is TE11.
