Hydraulic fracturing operation through coiled tubing is a safe, economical, and efficient well stimulation technique. During the operation, the wall of coiled tubing spooled on the reel is abraded and eroded by high-concentration proppants. Because of the high-concentration solid phase, a discrete phase model is not appropriate for erosion prediction during a hydraulic fracture operation.

Shale Gas Hydraulic Fracturing, Coil Tubing, Slick Water ...

A coiled tubing packer velocity string system uses a large bore packer & hydraulic disconnect or set down disconnect to release from the velocity string once the coiled tubing packer is set. The packer and disconnect are run in the well while the coiled tubing below is temporarily plugged using a shear-pinned pump-out plug for pressure control during installation.

Fracturing with Coiled Tubing | Schlumberger

The use of coiled tubing to fracture wells is relatively new and ideally suited for some fields. The limiting factor for well stimulations has been the size and strength of the coiled tubing itself. As tubing has grown larger and more robust, the opportunities for using coiled tubing have expanded. Nowhere is this more evident than in coiled-tubing fracturing operations.

Coiled-tubing fracturing operations | Offshore

Coiled tubing applications include drilling operations, hydraulic fracturing, well completions, removing sand or fill from wellbore, and other applications that involve pumping fluids at high temperatures and high salinity. Because of curvature effects in coiled tubing, huge pressure losses occur, limiting the maximum flow rate achieved.
