Lecture 2: Signals and systems: part I

More seriously, signals are functions of time (continuous-time signals) or sequences in time (discrete-time signals) that presumably represent quantities of interest. Systems are operators that accept a given signal (the input signal) and produce a new signal (the output signal). Of course, this is an abstraction of the processing of a signal.

Continuous-time signals and systems never take a break. When a circuit is wired up, a signal is there for the taking, and the system begins working — and doesn't stop. Keep in mind that the term signal is used here loosely; any one specific signal may come and go, but a signal is

Signals and Systems: Part I In this lecture, we consider a number of basic signals that will be important building blocks later in the course. Specifically, we discuss both continuous-time and discrete-time sinusoidal signals as well as real and complex exponentials. Sinusoidal signals for both continuous time and discrete time will be-

A system is any process that produces an output signal in response to an input signal. This is illustrated by the block diagram in Fig. 5-1. Continuous systems input and output continuous signals, such as in analog electronics. Discrete systems input and output discrete signals, such as computer programs that manipulate the values stored in arrays.

1.1 Continuous and Discrete Signals and Systems

Continuous signal: A signal of continuous amplitude is called continuous signal or analog signal. Continuous signal has some value at every instant of time. Examples: Sine wave, cosine wave, triangular wave etc. similarly some electrical signals derived from physical quantities like temperature, pressure, sound etc. are also an examples of ...

H.S. Chen Chapter1: Classification of signals and systems 10 • The above three properties are not true for a discrete-time signal $x[n]=e^{j\omega_0 n}$. 1. For a discrete-time signal, we have $x[n]=e^{j(\omega_0+2\pi)n} = e^{j\omega_0 n} \times e^{j2\pi n} = e^{j\omega_0 n}$ i.e., the signal $x[n]$ at frequency $(\omega_0 + 2\pi)$ is the same as that at frequency ω_0 , that is unlike the continuous case: $e^{j\omega_1 t} = e^{j\omega_2 t}$ if $\omega_1 = \omega_2$

Continuous-Time Signals and Systems - dummies

1.1 Continuous and Discrete Signals and Systems A continuous signal is a mathematical function of an independent variable t , where t represents a set of real numbers. It is required that signals are uniquely defined in t except for a finite number of points. For example, the function \sqrt{t} does not qualify for a signal even for $t \geq 0$ since the square root

First, digital computers are, by design, discrete-time devices, so discrete-time signals and systems includes digital computers. Second, almost all the important ideas in discrete-time systems apply equally to continuous-time systems. Alas, even discrete-time systems are too diverse for one method of analysis.
