Data abstraction is one of the widely used tools in data structures. The goal is to break down complex entities into smaller problems and solve these by using the concepts of data structures. This provides users with the advantage of being focused on the operations and not worried about how the data is stored or represented in the memory.

Primary components. There are three major components in Room: The database class that holds the database and serves as the main access point for the underlying connection to your app's persisted data.; Data entities that represent tables in your app's database.; Data access objects (DAOs) that provide methods that your app can use to query, update, insert, and delete data in the database.

static Keyword in Java - GeeksforGeeks

Database systems comprise complex data structures. In order to make the system efficient in terms of retrieval of data, and reduce complexity in terms of usability of users, developers use abstraction i.e. hide irrelevant details from the users. This approach simplifies database design. There are mainly 3 levels of data abstraction:
