We write dx instead of "x heads towards O". And "the derivative of" is commonly written : $x^2 = 2x$ "The derivative of x^2 equals $2x$ " or simply "d dx of x^2 equals $2x$ ". What does $x^2 = 2x$ mean?. It means that, for the function x^2 , the slope or "rate of change" at any point is $2x$. So when $x=2$ the slope is $2x = 4$, as shown here:. Or when $x=5$ the slope is $2x = 10$, and so on.

An ideal derivative is not causal, so that implementations of PID controllers include an additional low-pass filtering for the derivative term to limit the high-frequency gain and noise. Derivative action is seldom used in practice though - by one estimate in only 25% of deployed controllers [citation needed] - because of its variable impact on system stability in real-world applications.

Use the diff function to approximate partial derivatives with the syntax $Y = \text{diff}(f)/h$, where f is a vector of function values evaluated over some domain, X , and h is an appropriate step size. For example, the first derivative of $\sin(x)$ with respect to x is $\cos(x)$, and the second derivative with respect to x is $-\sin(x)$.
