Design of Experiments with MINITAB Details Most of the classic DOE books were written before DOE software was generally available, so the technical level that they assumed was that of the engineer or scientist who had to write his or her own analysis software.

Designing an Experiment - Minitab

What's Design of Experiments – Full Factorial in Minitab? DOE, or Design of Experiments is an active method of manipulating a process as opposed to passively observing a process. DOE enables operators to evaluate the changes occurring in the output (Y Response,) of a process while changing one or more inputs (X Factors).

Also, a well-designed experiment will ensure that you can evaluate the effects that you have identified as important. For example, if you believe that there is an interaction between two variables, be sure to include both variables in your design. Interactions are impossible to estimate from a "one factor at a time" experiment.

Howell, an avid baker and a quality professional at Scheider Electric, used Minitab's design of experiments (DOE) tools to get to the bottom of why his cookies failed to hold their shape. A designed experiment consists of a series of runs, or tests, in which you adjust multiple variables—for instance, the proportions of the ingredients used to make a batch of cookie dough.

Looking at Display Available Designs in Minitab, we can conduct a fractional factorial experiment using either a resolution III or a resolution V design for the 5 factor helicopter experiment. A resolution III design would only need 8 runs, but the resolution V design that requires 16 test runs is the better option.
