This will bevel two surface plains. The degree of the smooth curve will be set by the Track Curvature. If the Track Curvature is set to 1 then there will be a sharper edge kept between the two defined surface areas. Path. The Path button draws a line that sets a path that the stroke will follow.

The pump's piston diameter and stroke length are known, but you must calculate the strokes-per-minute (RPM) needed to attain the desired 12 ml/minute flow rate. Volume pumped per stroke is given by this equation: $\pi(D/2)^2 \cdot L$. Given $D = 0.8$ and $L = 2.5$, each stroke displaces 1.256 ml. So to achieve a flow of 12 ml/minute the RPM is 9.549.

A stroke is a medical condition in which poor blood flow to the brain causes cell death. There are two main types of stroke: ischemic, due to lack of blood flow, and hemorrhagic, due to bleeding. Both cause parts of the brain to stop functioning properly. Signs and symptoms of a stroke may include an inability to move or feel on one side of the body, problems understanding or speaking ...

Simulation is a technique for practice and learning that can be applied to many different disciplines and trainees. It is a technique (not a technology) to replace and amplify real experiences with guided ones, often "immersive" in nature, that evoke or replicate substantial aspects of the real world in a fully interactive fashion.

A crankshaft is a shaft driven by a crank mechanism, consisting of a series of cranks and crankpins to which the connecting rods of an engine is attached. It is a mechanical part able to perform a conversion between reciprocating motion and rotational motion.In a reciprocating engine, it translates reciprocating motion of the piston into rotational motion, whereas in a reciprocating compressor ...

Design and Simulation of Four Stroke Engines by Gordon Blair is another good one. He also wrote a two stroke equivalent. I looked into doing something similar a few years ago but never got around to it. From my reading at the time it seemed like a small capacity single cylinder two stroke would be the easiest and cheapest place to start.

BOP2 design for two-arm randomized trials The 2-arm BOP2 design is an extension of BOP2 design to make go/no-go decisions for two-arm randomized trials. Similar to BOP2, it is flexible, allowing any arbitrary number of interim analyses and accommodating both binary and co-primary endpoints; and it is efficient by maximizing the power of the trial.
