### The Biology Project

Natural selection is the differential survival and reproduction of individuals due to differences in phenotype. It is a key mechanism of evolution, the change in the heritable traits characteristic of a population over generations. Charles Darwin popularised the term "natural selection", contrasting it with artificial selection, which in his view is intentional, whereas natural selection is not.

### Natural selection - Wikipedia

A fungus (plural: fungi or funguses) is any member of the group of eukaryotic organisms that includes microorganisms such as yeasts and molds, as well as the more familiar mushrooms. These organisms are classified as a kingdom, separately from the other eukaryotic kingdoms, those being Plantae, Animalia, Protozoa, and Chromista. A characteristic that places fungi in a different kingdom from ...

### Fungus - Wikipedia

A cell destined to form a foot, for example, might send a message to a neighboring cell directing its descendants to switch on genes that direct the cells outward and shape them into a leg. What's more, as embryos develop, their tissues shift around in relation to one another.
