Directed Rocks And The Rock

Amphibolite is a non-foliated metamorphic rock that forms through recrystallization under conditions of high viscosity and directed pressure. It is composed primarily of hornblende (amphibole) and plagioclase, usually with very little quartz.The specimen shown above is about two inches (five centimeters) across.

Metamorphic Rocks | Pictures of Foliated and Non-Foliated ...

Rock bodies that cool beneath the surface are generally described as Plutons.A batholith is a large former magma chamber, often many miles across. A sill is a sheetlike injection of magma between layers of sedimentary rock. A dike is a sheetlike body that fills a fracture that cuts across other rocks. A laccolith is a small magma chamber at shallow depth (roughly lens shaped).

Minerals, Rocks & Rock Forming Processes

Phyllite is a very common metamorphic rock, found in many parts of the world. It forms when sedimentary rocks are buried and mildly altered by the heat and directed pressure of regional metamorphism. These are almost always convergent plate boundary environments involving continental lithosphere.

Phyllite: Metamorphic Rock - Pictures, Definition & More

7.2 Classification of Metamorphic Rocks There are two main types of metamorphic rocks: those that are foliated because they have formed in an environment with either directed pressure or shear stress, and those that are not foliated because they have formed in an environment without directed pressure or relatively near the surface with very little pressure at all.

7.2 Classification of Metamorphic Rocks - Physical Geology

The properties of sedimentary rocks vary slightly from rock to rock. Clastic sedimentary rocks are made up of rock and mineral grains you can see with the naked eye or a microscope. The texture of igneous rocks is either fragmental or crystalline. Sedimentary rocks are found mostly on the Earth's surface.

3 Main Types of Rocks and Their Properties

6.4 Metamorphic Environments. As with igneous processes, metamorphic rocks form at different zones of pressure (depth) and temperature as shown on the pressure-temperature (P-T) diagram. The term facies is an objective description of a rock. In metamorphic rocks facies are groups of minerals called mineral assemblages. The names of metamorphic facies on the pressure-temperature diagram reflect ...
