Bifurcation theory - Wikipedia

The purpose of the present chapter is once again to show on concrete new examples that chaos in one-dimensional unimodal mappings, dynamical chaos in systems of ordinary differential equations, diffusion chaos in systems of the equations with partial derivatives and chaos in Hamiltonian and conservative systems are generated by cascades of bifurcations under universal bifurcation Feigenbaum-Sharkovsky-Magnitskii (FShM) scenario.

Dynamical Systems Theory, Bifurcation Analysis | SpringerLink

Bifurcation theory is concerned with the description of the topological variation of the orbit structure of dynamical systems which depend on a parameter. This chapter discusses several concepts of stability which may be an appropriate guide for a systematic future study of bifurcations.

Dynamical Systems V Bifurcation Theory

Bifurcation theory and catastrophe theory are two of the best known areas within the field of dynamical systems. Both are studies of smooth systems, focusing on properties that seem to be manifestly non-smooth. Bifurcation theory is concerned with the sudden changes that occur in a system when one or more

Bifurcation Theory of Chaotic and Quasiperiodic Systems. Bifurcation theory has intensively investigated varied topics that bear on chaotic and quasiperiodic dynamics. Much of this theory has been developed in the context of discrete time dynamical systems defined by iteration of mappings.

Dynamical system - Wikipedia

Definition. Bifurcation theory refers to the study of qualitative changes to the state of a system as a parameter is varied. It can be applied to steady state systems, or to dynamical systems and can be understood best at the level of a mathematical model, although recent techniques allow the method to be applied to experiments with feedback control.
