Structural Dynamics is a theory of how face to face communication works (and does not work) in human systems. Its roots lie in systems theory, the study of phenomena as systems of interrelated parts. This model was developed through an empirical study of family communication over 35 years ago and has evolved and expanded over time an application to families, couples, teams and whole organizations.

INTRODUCTION TO DYNAMICS OF STRUCTURES

Often, a small component is attached to a larger structure that is not part of the simulation. When the component vibrates, some waves will be induced in the supporting structure and carried away. This phenomenon is often called anchor losses, particularly in the context of MEMS. Thermoelastic Damping
