line, make it necessary to examine the power system on an even smaller timescale, microsecond to millisecond. We speak in that case of electrical transients. The time that the electrical transients are present in the system is short, but during a transient period, the components in the system are subjected to high current and high-voltage peaks that can cause

Transients are power quality disturbances that involve destructive high magnitudes of current and voltage or even both. It may reach thousands of volts and amps even in low voltage systems. However, such phenomena only exist in a very short duration from less than 50 nanoseconds to as long as 50 milliseconds.

Causes and Effects of Transient Voltages
In electrical engineering, oscillation is an effect caused by a transient response of a circuit or system. It is a momentary event preceding the steady state (electronics) during a sudden change of a circuit [1] or start-up.

Power System Transients
electric fields generated during a discharge can couple into the power system, creating induced transients. A cloud-to-cloud discharge can generate a 70 Volts per meter electric field. On a 1/2-mile length of transmission line this is equal to a 56,000-volt transient--and it didn't even touch the line!

An electrical transient occurs on a power system each time an abrupt circuit change occurs. This circuit change is usually the result of a normal switching operation, such as breaker opening or closing or simply turning a light switch on or off.

Description : Transient Phenomena in Electrical Power Systems analyzes transient phenomena in electro-mechanical systems, and of the steady conditions which precede or follow such transient condition. The book deals with the short-period transient processes connected with changes in the electro-mechanical condition of the system, the normal steady state, and also the steady fault condition.

Transient (oscillation) - Wikipedia
Electromechanical transients are caused by mismatch between power production and consumption causing the generator to either speed up or slow down compared to its normal rotation speed. The reason for that is usually a disturbance in a system such as the outage of a nearby transmission line.
