At coolant temperatures below approximately 86 – 89 ° C (186 – 193 ° F) for vehicle, industrial or keel-cooled marine engines or 69 – 73 ° C (156 – 163 ° F) for heat exchanger-cooled marine engines, the thermostat valves remain closed and block the flow of coolant from the engine to the radiator heat exchanger.

### How to Troubleshoot the Jeep Grand Cherokee's Cooling Fan ...

Your vehicle's cooling system keeps your engine from burning up from its own heat by pushing coolant that is cooled in the radiator through passages on the engine block and head. The system is somewhat more complex than that, with power transferred from the serpentine belt to the fan to keep the system moving.

### How an engine cooling system works | How a Car Works

The engine in your car runs best at a fairly high temperature. When the engine is cold, components wear out faster, and the engine is less efficient and emits more pollution. So another important part of the cooling system is to allow the engine to heat up as quickly as possible, and then to keep it at a constant temperature.
