One other minor difference between engine types is that the overhead valve engines have a lower center of gravity, owing to the cam, timing gear/chain and pushrods being low in the engine. Performance cars like the Corvette have a very low center of gravity, giving them excellent handling, grip and safety, which they owe in part to the engine.

The first overhead camshaft (OHC) engine dates back to 1902, however use of this design was mostly limited to high performance cars for many decades. OHC engines slowly became more common from the 1950s to the 1990s, and by the start of the 21st century, the majority of automotive engines (except for North American V8 engines) used an OHC design.

Honda successfully uses the SOHC design in its late V6 engines where four valves per cylinder are operated by a single camshaft. The downside of an OHC engine is that it requires a timing belt or chain with a tensioner and other related components. A timing belt must also be replaced at regular intervals.

Rated at a rather anemic 210 horsepower, the 4.0L SOHC V6 is not exactly a high output engine. It also has an unusual overhead cam drive setup. Unlike most other OHC V6 and V8 engines that drive both overhead cams directly from the crankshaft with a belt or chain, this engine has an intermediate jackshaft in the middle of the block where a pushrod cam would normally be located.
