Insecticide-Treated Bed Nets - CDC

The development of resistance to drugs poses one of the greatest threats to malaria control and results in increased malaria morbidity and mortality. Resistance to currently available antimalarial drugs has been confirmed in only two of the four human malaria parasite species, *Plasmodium falciparum* and *P. vivax*.

Drug Resistance in the Malaria-Endemic World - CDC

Products of natural origin remain important in the discovery of new bioactive molecules and are less damaging to the environment. Benzaldehyde is a product of the metabolism of plants, and similarly to oxygenated terpenes, it can have antibacterial activity against *Staphylococcus aureus* and toxic action against *Drosophila melanogaster*; we aimed to verify these activities.

Insecticide resistance is a growing threat to malaria vector control. Ivermectin, either administered to humans or animals, may represent an alternate strategy to reduce resistant mosquito populations. The aim of this study was to assess the residual or delayed effect of administering a single oral dose of ivermectin to humans on the survival, fecundity and fertility of *Anopheles arabiensis* in ...

Though stability of resistance across environments over nearly 10 years of evaluation does not guarantee the resistance will be durable in absolute terms, it is expected to be durable enough to fully control the disease long enough to establish a sustainable management of LB disease in potato based on a rotation of events with different R-gene ...

Evaluation Of Insecticide Resistance Management

The use of insecticide-treated bednets (ITNs) or long-lasting insecticidal nets (LLINs) are of major importance to countries planning to eliminate malaria such as India. In June, 2021, Steve Lindsay and colleagues¹ reflected well on the threat to effectiveness of ITNs and the need to think beyond insecticide resistance. We agree with the authors that there is insufficient evidence to support ...

Insecticide resistance and ITNs in India - The Lancet ...

Insecticide-treated bed nets (ITNs) are a form of personal protection that has been shown to reduce malaria illness, severe disease, and death due to malaria in endemic regions. In community-wide trials in several African settings, ITNs were shown to reduce the death of children under 5 years from all causes by about 20%.
