(5) for 2-dimensional interpolation. There a new set of  $5 \times 7$  and  $7 \times 5$  matrices are created from the input set of  $3 \times 4$  and  $4 \times 3$  matrices respectively. The central point of these new sets of matrices are two new predicted values for the target pixel. These two intensity values, with the four values from one-

Here, we take the seismic interpolation as an image super-resolution problem and will adopt a similar RDNet as the study of Zhang et al. (2018) for seismic interpolation. Figure 1 shows the architecture of the RDNet, in which the input is seismic data with missing traces, and output is the data after interpolation.

The f-k interpolation method is based on creating a mask function from the low frequency portion of the data and applying it to interpolate the high frequencies. The mask function is created by properly zero-padding and zero-interlacing the original data. The principle of the f-k interpolation remains the same for 3D and higher dimensional data.

for a given location on the square the bits encode only the walls in the \*positive\* direction of each axis. For example, for a 2d maze the bits encode the presence of a wall wall in the "down" and "right" directions, respectively (but the ability to move "up" or "left" is determined by the presence of walls in the corresponding neighboring squares).
