Mass spectrometry (MS) is an analytical technique that is used to measure the mass-to-charge ratio of ions. The results are presented as a mass spectrum, a plot of intensity as a function of the mass-to-charge ratio. Mass spectrometry is used in many different fields and is applied to pure samples as well as complex mixtures.

4.1 UV-visible spectroscopy. It is useful in characterising the colour in terms of the wavelength of maximum absorption and dominating hue. The application of UV-characterization is to identify the ability of dye molecules to absorb UV wavelength and fading characteristics of dyes. Some researchers had done UV analysis of natural dyes.

The Raman spectrum obtained from the BDD/Si electrode surface (Fig. 1B, where the intensity is normalized to 1.0 for the most intense peak) is typical for a heavily B-doped diamond film .Two broad and intense peaks located at ʔ 450 and ʔ 1200 cm ʔ1 dominate the Raman spectrum. These signals, referred to as the lower and higher boron peaks, respectively, arise from the incorporation of ...
