The borehole seismic measurement system has three components: surface source, depth measurement, and a downhole geophone (Figure 11-1). The surface pulse can be anything used as a seismic source: vibrator, dynamite, air-gun, thumper, etc However, as the number of recorded levels increases, dynamite becomes less suitable.

## **LEADERS IN BOREHOLE SEISMIC TECHNOLOGY**

Resistivity logs are electrical well logs that record the resistivity of a formation. Resistivity is usually recorded in ohm meters (?m) and is displayed on track 4 of a well log. Three depths of resistivity can be logged (shallow, medium, and deep) that record the resistivity of the formation with increasing distance away from the borehole.
