Measurement is an integral part of modern science as well as of engineering, commerce, and daily life. Measurement is often considered a hallmark of the scientific enterprise and a privileged source of knowledge relative to qualitative modes of inquiry. [] Despite its ubiquity and importance, there is little consensus among philosophers as to how to define measurement, what sorts of things are ...

Cybernetics is a transdisciplinary approach for exploring regulatory systems—their structures, constraints, and possibilities. Norbert Wiener defined cybernetics in 1948 as "the scientific study of control and communication in the animal and the machine." In other words, it is the scientific study of how humans, animals and machines control and communicate with each other.

In computer science and optimization theory, the max-flow min-cut theorem states that in a flow network, the maximum amount of flow from the source to the sink is equal to the total weight of the edges in the minimum cut, i.e. the smallest total weight of the edges whose removal would disconnect the source from the sink.. The max-flow min-cut theorem is a special case of the duality ...

It but remains to call attention to the fact that the earlier view of the liver as the seat of the soul gave way among many ancient nations to a theory which, reflecting the growth of anatomical knowledge, assigned that function to the heart, while, with the further change which placed the seat of soul-life in the brain, an attempt was made to partition the various functions of ...
