Goldstein 2.2 The canonical momentum p is defined as $p = \frac{\partial L}{\partial \dot{q}} = \frac{\partial T}{\partial \dot{q}} - \frac{\partial U}{\partial \dot{q}}$ (1) where $T = T(\mathbf{r}; \dot{\mathbf{r}})$ and $U = U(\mathbf{r}; \mathbf{r}_i)$ are kinetic and potential energy of the system, which then define the Lagrangian $L = T - U$.

4 Goldstein 8.26 4.1 Part (a) In the given configuration, both springs elongate or compress by the same magnitude. Suppose q denotes the position of the mass m from the left end. At $t = 0$, $q(0) = a = 2$, but the unstretched lengths of both springs are given to be zero. Therefore, the elongation (compression) of spring k

This course closely followed H. Goldstein's "Classical Mechanics" (3rd Ed.), although we jumped around a bit and also skipped the section on relativity. Many of the homework problems were created by the instructor or taken from past qualifying exams, so I only included solutions for the problems out of Goldstein. Resources:

will make it easy to get answers for even the toughest questions. Whether, you have problems tackling maths, physics, calculus, accounting and writing assignments and much more, there will be homework solutions available for you.

Physics 316--Classical Mechanics - Harvey Mudd College
Solutions 171 The trajectory drawn with an angle of $\theta = 45$ degrees ($|z| = 1$) and a tacking $\theta \rightarrow -\theta$ at $x = L/2$ has a total length $L\sqrt{2}$ and a velocity greater than $(w_0 - w_1)/2$. The time along this path, $T_v = 2L\sqrt{2}/(w_0 - w_1)$, is obviously shorter than the time along the path with no tacking, $T_{rv} = 2L(z/L)/(w_0 - w_1) = 2z/(w_0 - w_1)$. In realistic cases, for instance the America's Cup, one can see how

PHY 5246: Theoretical Dynamics, Fall 2015 Assignment # 3, Solutions 1 Graded Problems Problem 1 (1.a) We use cylindrical coordinates and notice that $z = r \cot \theta$. We use $\{r, \theta\}$ as generalized coordinates and write the kinetic energy of the bead as $T = \frac{1}{2} m (\dot{r}^2 + r^2 \dot{\theta}^2 + \dot{z}^2) = \frac{1}{2} m (1 + \cot^2 \theta) \dot{r}^2 + r^2 \dot{\theta}^2$, (1) and its potential energy as $V \dots$
