The Energy Institute document 'Guidelines for the Avoidance of Vibration Induced Fatigue Failure in Process Pipework' is the industry standard for evaluating vibration integrity risks. 21% of hydrocarbon releases are due to vibration-induced fatigue failures (UK Health & Safety Executive), Around 80% of vibration-induced failures are associated with small-bore connections (SBCs). The remaining 20% are generally associated with parent pipe girth weld failure.

The Energy Institute (EI) publication 'Guidelines for the Avoidance of Vibration Induced Fatigue Failure in Process Pipework'\* contains an assessment chart to determine whether pipes are likely to suffer fatigue based on frequency and velocity of movement – and the levels for concern might be surprising. In fact, problematic vibration may not even be visible to the human eye as even at dangerous levels, prolonged movements of only 0.5mm can produce fatigue failure.
