Despite all this, Bohr's is probably still the model of the atom you're most familiar with, since it's often the one first introduced during high school or secondary school chemistry courses. It still has its uses too; it's quite handy for explaining chemical bonding and the reactivity of some groups of elements at a simple level.

In atomic physics, the Rutherford–Bohr model or Bohr model, presented by Niels Bohr and Ernest Rutherford in 1913, is a system consisting of a small, dense nucleus surrounded by orbiting electrons—similar to the structure of the Solar System, but with attraction provided by electrostatic forces in place of gravity.

HISTORY OF THE ATOM 1856 - 1940 Joseph John Thompson In 1904, Thompson develops the idea that an atom was made up of electrons scattered unevenly within an elastic sphere surrounded by a soup of positive charge to balance the electron's charge. It is called the plums pudding model. He was awarded a Nobel Prize in 1906 for discovering the Electron.

In 1913, Niels Bohr proposed the Bohr model, which states that electrons only orbit the nucleus at specific distances from the nucleus. According to his model, electrons couldn't spiral into the nucleus but could make quantum leaps between energy levels.

John Dalton introduced a new form of the ancient Greek idea of atoms at the beginning of the nineteenth century. In 1897, J.J. Thomson discovered the electron and suggested the 'plum pudding' model of the atom. In 1911, Rutherford suggested that electrons orbit the atomic nucleus like planets round the Sun.

Once students have recorded their initial idea of the atom I begin to explain the history of the atom. I go through the history of the atom starting with Democritus and ending with the Quantum Mechanical model. I do this by presenting a PowerPoint while students fill in information on their notes graphic organizer.

History of the Atomic Model

Democritus was the first scientist to create a model of the atom. He was the first one to discover that all matter is made up of invisible particles called atoms. He created the name "atom" from the Greek word "atomos", which means uncuttable. He also discovered that atoms are solid, indestructable, and unique. His model was just a round solid ball.
