The following is a modified excerpt from Applied Qualitative Research Design: A Total Quality Framework Approach (Roller & Lavrakas, 2015, pp. 107-109). Fundamental to the design of a focus group study is group composition. Specifically, the researcher must determine the degree of homogeneity or heterogeneity that should be represented by the group participants.

Homogeneity To Heterogeneity A Study
However, most meta-analyses include between 2-4 studies and such a sample is more often than not inadequate to accurately estimate heterogeneity. Thus it appears that in small meta-analyses, an incorrect zero between study variance estimate is obtained, leading to a false homogeneity assumption.

Study heterogeneity - Wikipedia
For homogeneity of variance see homoscedasticity,. In statistics, homogeneity and its opposite, heterogeneity, arise in describing the properties of a dataset, or several datasets.They relate to the validity of the often convenient assumption that the statistical properties of any one part of an overall dataset are the same as any other part.

Chapter 6 Between-study Heterogeneity. By now, we have already shown you how to pool effect sizes in a meta-analysis. In meta-analytic pooling, we aim to synthesize the effects of many different studies into one single effect.However, this makes only sense if we aren't comparing Apples and Oranges.For example, it could be the case that while the overall effect we calculate in the meta ...

The purpose of this test was to assess the extent of variation between the sample estimates. Heterogeneity would exist if the sample estimates for the population relative risk were of different magnitudes or had the opposite direction of effect (a is true). Conversely, if homogeneity existed the estimates would be of a similar magnitude and ...

Dealing with heterogeneity We have already discussed the meaning and detection of heterogeneity in the previous lecture, 'Meta-analysis: methods for quantitative data synthesis'. In this lecture we look at how to deal with it when we have it. There are a number of possibilities. First, we could decide not to pool the study estimates at all.

Both clinical and genetic heterogeneity contribute to overall study heterogeneity. Clinical heterogeneity consists of differences in stroke subtypes as depicted in Figure 56.1 , differences in the pathological mechanisms that lead to those subtypes, differences in anatomical location of the stroke as depicted in Figure 56.2 , and differences in the patient population with respect to age ...

The opposite of a homogeneous sample is a heterogeneous sample. For this example, you might have a heterogeneous sample of 18-21 year old students in history 112, chemistry 211 and physics 101. The same is true for a heterogeneous population (all items in the population have different characteristics) and a homogeneous population (all items in the population have the same characteristics).
