This calculator does basic arithmetic on complex numbers and evaluates expressions in the set of complex numbers. As imaginary unit use i or j (in electrical engineering), which satisfies basic equation $i^2 = -1$ or $j^2 = -1$. The calculator also provides conversion of a complex number into angle notation (phasor notation), exponential, or polar coordinates (magnitude and angle).

You can put this solution on YOUR website! You really need to use parentheses so that it is clear what you mean. Here, you might mean: In which case, this is already simplified as much as possible. On the other hand if you meant, as I suspect: Then you really should have rendered your problem thus: $1/(2 - i)$. Having said all that,

sqrt(i) - Math2.org

A summation method that is linear and stable cannot sum the series $1 + 2 + 3 + \dots$ to any finite value. (Stable means that adding a term to the beginning of the series increases the sum by the same amount.) This can be seen as follows. If $1 + 2 + 3 + \dots = x$, then adding 0 to both sides gives $0 + 1 + 2 + \dots = 0 + x = x$ by stability.
