An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

The Internal Combustion Engine is a gas turbine plant as shown in figure below where fuel is mixed with air and burned. The hot gasses are passed through the turbines to generate power and then the gases are exhausted through exhaust valve. In this case same working fluid cannot be used over again and again in the repeated cycle.

HOW IT WORKS: Internal Combustion Engine

The principle behind any reciprocating
internal combustion engine: If you put a
tiny amount of high-energy-density fuel
(like gasoline) in a small, enclosed space
and ignite it, an incredible amount of
energy is released in the form of
expanding gas. You can use that energy
for interesting purposes.
