Sensitivity to geometry has also been noted in fluid mechanics. Spurious entropy layers about aerodynamic shapes were the bane of compressible Euler solvers in the 1980s and 1990s. The problem and its solution were identified in the thesis of Barth . Piecewise linear approximations of geometry were the root cause.

Category theory formalizes mathematical structure and its concepts in terms of a labeled directed graph called a category, whose nodes are called objects, and whose labelled directed edges are called arrows (or morphisms). A category has two basic properties: the ability to compose the arrows associatively, and the existence of an identity arrow for each object.
