models that assign class labels to problem instances, represented as vectors of feature values, where the class labels are drawn from some finite set. There is not a single algorithm for training such classifiers, but a family of algorithms based on a common principle: all naive Bayes classifiers assume that the ...

rior is, in some sense, objective. Empirical Bayesians estimate the prior distribution from the data. Frequentist Bayesians are those who use Bayesian methods only when the resulting posterior has good frequency behavior. Thus, the distinction between Bayesian and frequentist inference can be somewhat murky. This has led to much confusion in ...

Similarly, in `wexample10_bayes.ctf`, an ITS estimation is performed first and then BAYES estimation. This can be beneficial to improving stability and reducing the burn-in time required for BAYES, as the BAYES method will use as initial values the final population and individual parameters that were assessed by ITS.
