The first major use of the specification language was by Peter Naur, the secretary of the ALGOL committee and the author of the first ALGOL Report. Naur slightly extended the notation and thereafter it got the name Backus-Naur Form.

Appendix: Extended Backus-Naur Form (EBNF) One of the most significant design improvements in XML is to make it easy to use with modern compiler tools. Part of this improvement involves making it possible to express the syntax of XML in Extended Backus-Naur Form (EBNF) [Section 6].

BNF and EBNF: What are they and how do they work?
Extended Backus Naur Form (EBNF) is a metalanguage and is used in this guide to describe the language syntax. An EBNF definition consists of production rules, nonterminals, and terminals. The key terms are shown in the following table.

Backus-Naur form explained
This notation is referred to as Backus-Naur Form (BNF) or extended BNF (EBNF). BNF (Backus-Naur Form) is a syntactic metalanguage (i.e., a language about a language). The metalanguage is a formal notation for specifying the grammar that describes the syntax of a programming language. BNF was originally developed by John Backus and subsequent contribution from Peter Naur to describe the syntax of Algol 60 programming language.

accepts a new input speci cation based on Extended Backus-Naur Form (EBNF) called Typed-EBNF (TEBNF) (see appendix A). The tool validates key features of TEBNF. Can describe input patterns that include a mixture of strings, numbers, and/or raw groupings of bytes. Integrates grammar rules with states and actions.

Introduction To Extended Backus Naur
The extended Backus-Naur form (EBNF) is a common one. Another common extension is the use of square brackets around optional items. Although not present in the original ALGOL 60 report (instead introduced a few years later in IBM 's PL/I definition), the notation is now universally recognised.

EBNF: A Notation to Describe Syntax
Extended Backus-Naur Form is a metalanguage, a language used to describe another language, just like a metawebsite is a website about a website, and just like metatables, in Lua, are tables that define the behavior of other tables (you'll learn about metatables and tables later in this book). But you're not going to have to learn extended Backus-Naur form in this book, because, while a language like Lua can be described using a metalanguage, it can also be described using words and ...
