Chapter 1 (Introduction to Vectors) Section 1.1 (Vectors and Linear Combinations) Problem 16 (dimensions of a cube in four dimensions) We can generalize Problem 15 by stating that the corners of a cube in four dimensions are given by $n(1,0,0,0)+m(0,1,0,0)+l(0,0,1,0)+p(0,0,0,1)$, for indices n,m,l,p taken from $\{0,1\}$.

Introduction to Linear Algebra 5th Edition by Gilbert Strang This is an erudite and discursive introduction to linear algebra, weighted heavily toward matrices and systems of linear equations. The author has an expansive view of linear algebra, and from time to time draws in some calculus, Fourier series, wavelets, and function spaces, but the approach is always very concrete.

toward linear algebra. Working with curved lines and curved surfaces, the first step is always to linearize. Replace the curve by its tangent line, fit the surface by a plane, and the problem becomes linear. The power of this subject comes when you have ten variables, or 1000 variables, instead of two.

The crucial operation in linear algebra is to take linear combinations of column vectors. This is exactly the result of a matrix-vector multiplication. Ax is a combination of the columns of A . When we take all combinations Ax of the column vectors, we get the column space.
