### Review for Quiz 2: Ionic and Covalent Compounds

An ionic bond essentially donates an electron to the other atom participating in the bond, while electrons in a covalent bond are shared equally between the atoms. The only pure covalent bonds occur between identical atoms. Usually, there is some polarity (polar covalent bond) in which the electrons are shared, but spend more time with one atom than the other. Ionic bonds form between a metal and a nonmetal. Covalent bonds form between two nonmetals.

Covalent bonds are awesome, because they allow for a vast variety of compounds, much more than ionic bonds. Because of covalent bonding we have things like water ( $H_2O$ ), carbon dioxide ( $CO_2$ ), the kind of alcohol that people drink ( $C_2H_5OH$ ), and even larger compounds like aspirin, estrogen, and testosterone.
