chemical reagents and absorb some of the leaching compound. To optimize metal recovery and minimize potential losses, the system must have a low permeability layer to reduce and minimize seepage losses. The leach pad must be totally void of "preg-robbing" materials such as carbon that may remove gold and silver from the pregnant solution.

Leaching Chemical Engineering

Leaching is the process of a solute becoming detached or extracted from its carrier substance by way of a solvent.. Leaching is a naturally occurring process which scientists have adapted for a variety of applications with a variety of methods. Specific extraction methods depend on the soluble characteristics relative to the sorbent material such as concentration, distribution, nature, and size.

Leaching (chemistry) - Wikipedia
Leaching is a solid-liquid extraction process. The process of leaching generally concerns with processes where the solid is inert and contains soluble solute which is extracted from the inert solid with the help of chemical reaction; for example leaching of valuable metals from waste materials by using sulphuric acid.

Basics of Leaching - Chemical Engineering Resources

Leaching is the process by which constituents of a solid material are released into a contacting water phase. Although some species may be more of an environmental concern than others, the leaching process is indiscriminant such that all constituents (e.g., major or minor matrix components as well as inorganic, organic and radionuclide contaminants) are released..
