Linear Accelerators for Radiation Therapy

A linear accelerator (LINAC) is a device that uses high Radio-Frequency electromagnetic waves to accelerate charged particles in a linear path or straight lines, inside a tube like structure called the accelerator waveguide. It is commonly used to treat cancer with external beam radiation. Parts of a Linear Accelerator. 1. Drive Stand.

Linear Accelerator - Radiation, Therapy ,Review

Linear Accelerators. The most common modality used in radiation oncology is external beam radiation therapy. Although a small number of radiation therapy facilities generate external beams using radioactive sources such as cobalt-60, the vast majority of therapeutic electromagnetic radiation is generated in a linac.

The control console operates the accelerator during radiation treatment delivery, the modulator houses the electronic system of the accelerator, and the therapy module houses the accelerator guide and control system that generate and deliver radiation. 2 In addition to the mobile electron linear accelerator, additional supplies and equipment are needed.

Linear Accelerators For Radiation Therapy

What is this equipment used for? A medical linear accelerator (LINAC) is the device most commonly used for external beam radiation treatments for patients with cancer. It delivers high-energy x-rays or electrons to the region of the patient's tumor. These treatments can be designed in such a way that they destroy the cancer cells while sparing the surrounding normal tissue.

Role Of The Linear Accelerator (LINAC) In Cancer Radiation ...

Most radiation therapy treatments use irradiation generated by linear accelerators, which impart a series of relatively small increases in energy to particles such as protons, carbon ions, or neutrons.

The RT machine uses a high energy linear accelerator (LINAC) as the source of the ionizing radiations which can be high energy electron beams, or X-rays (photon beams of an X-Ray linear accelerator). In radiation therapy, the majority of radiation treatments use X-rays and a smaller number uses the electron beam or a combination of both therapies.
