Interaction And Water Producti

At the same time, livestock systems have a significant impact on the environment, including air, land, soil, water, and biodiversity. This sector growth needs to be addressed in the context of finite natural resources, contribution to livelihoods and long-term food security, and climate change responses.

Water use of livestock production systems and supply chains

The water productivity approach has been used to assess benefits derived from consumptive water use in livestock production; the water footprint approach has raised awareness of the large amounts of water required for livestock production; and life cycle assessments highlight the important connection between

### Livestock Water Use - USGS

Water is essential for maintaining an adequate food supply and a productive environment for the human population and for other animals, plants, and microbes worldwide. As human populations and economies grow, global freshwater demand has been increasing rapidly (Hinrichsen et al. 1998, Postel 1999, Rosegrant et al. 2002, Shiklomanov and Rodda 2003, UNEP 2003a, Gleick 2004).

These water challenges are expected to strongly impact agriculture – a highly water-dependent sector – undermining the productivity of rain-fed and irrigated crops and livestock activities particularly in certain countries and regions. These changes could in turn further impact markets, trade, and broader food security.

Livestock and Water - Johnson County Extension Office

Water is different than many other natural resources that are traded because the costs of transport are very significant in comparison to the understated economic value of water and, perhaps more importantly, because of perceptions about the human right to water, and objections to the commodification of the resource [Gleick et al., 2002; Hoekstra and Chapagain, 2008].

Water Resources: Agricultural and  
Environmental Issues ...

The large water footprints for beef, pork and other meats indicate the large volumes of water used for their production. They also suggest a great use of resources beyond water. The question then becomes, why is raising livestock and poultry for meat so resource-intensive? The answer is mainly based on the food that livestock eat.

livestock to known increases in temperature is predictable, in terms of increased demand for water, attempts to quantify the impacts of climate change on water resources in the land-based livestock systems in developing countries are fraught with uncertainty, particularly in situations where groundwater accounts for a substantial portion of the supply of water ...

Consumptive water use in livestock production

Livestock production interacts with the water resources directly or indirectly and the interaction can be positive or negative depending on the type of production. Evidences suggest that there is a huge knowledge gap and much misinformation about livestock's use of and impact on water resources.
