1.1.1. The lubrication regimes. The modern period of lubrication began with the work of Osborne Reynolds (1842-1912). Reynold's research was concerned with shafts rotating in bearings and cases this show in Fig.1.When a lubricant was applied to the shaft, Reynolds found that a rotating shaft pulled a converging wedge of lubricant between the shaft and the bearing.

S. Xiong, in Reference Module in Materials Science and Materials Engineering, 2016. 3 Lubrication. Lubricant is widely used when reduced friction and wear is needed. The main function of lubricant is to introduce a shearable or viscous layer between sliding surfaces. As the solid to solid contacts are replaced by the solid to lubricant contact, the shear strength between the interfaces is reduced.

A lubricant is a substance, usually organic, introduced to reduce friction between surfaces in mutual contact, which ultimately reduces the heat generated when the surfaces move. It may also have the function of transmitting forces, transporting foreign particles, or heating or cooling the surfaces. The property of reducing friction is known as lubricity.
