United Nations*, IPM means considering all available pest control techniques and other measures that discourage the development of pest populations, while minimizing risks to human health and the environment. For farmers, IPM is the best combination of cultural, biological and chemical measures to manage diseases, insects, weeds and other pests.

certain vertebrate species), insect pests alone may cause a loss to the tune of about 15.6% of the total crop production globally (Oerke 2006). The insects cover approximately 3/4th of the entire world fauna, but not all the insects are considered as pests (Table 27.1).

Management Of Insect Pests Of
Biological pest control is a method of controlling pests such as insects and mites by using other organisms. It relies on predation, parasitism, herbivory or other natural mechanisms, but typically also involves an active human management role. Classical biological control involves the introduction of natural enemies of the pest that are bred in the laboratory and released

microbes to control pests. Several species of beneficial insects that attack the major pest insects in stored grain, including granary weevil, rice weevil, maize weevil, rusty grain beetle, lesser grain borer, confused flour beetle, sawtooth grain beetle, Angoumois grain moth, and Indianmeal moth are commercially available.

Management of Stored Grain Pests in Organic Systems

The management of insect pests rarely relies on a single control practice; usually a variety of tactics are integrated to maintain pests at acceptable levels. The goal of integrated pest management is not to eliminate all pests; some pests are tolerable and essential so that their natural enemies remain in the crop.
