Noise heard in forward gears, but not reverse or neutral. Usually means a problem with the counter shaft. Noises heard whenever the clutch is engaged or disengaged. This is usually not caused by the transmission; it's most often a problem with the clutch bearing. Noise appears when the transmission is in neutral but the clutch is engaged.

What Are the Reasons for Rattling Noise When Accelerating?

If a manual transmission makes noises just when the clutch pedal is all the way up or engaged and a grinding or rattling noise is heard, the throw-out bearing for the clutch is bad. If the transmission makes a rattling noise that is loudest in neutral, although it is always there, and the noise changes when it is put into gear, but shifts well, the input shaft bearing is bad.
