ADC_LPC1768 - John Kneen: Microcontrollers

An ADC (Analog-to-Digital Converter) is a peripheral that allows measuring the voltage (between 0 and V_{ref}) on a certain input of the microcontroller and converting it into a number between 0 and 2^N-1 where N is the ADC resolution.

If this bit is set the ADC module will do the conversion for all the channels that are selected (SET) in SEL bits. Clearing this bit will disable the BURST conversion. Bit 21 – PDN : Power Down Mode Setting this bit brings ADC out of power down mode and makes it operational. Clearing this bit will power down the ADC.

Mbed Adc Resolution

The resolution for an ADC is the smallest distinguishable change in analog input that causes the digital output to change. For example, a 12-bit ADC in a 3.3V system has 4,096 distinguishable outputs. Therefore, the resolution of a 12-bit ADC is 3.3/4096 = 0.81mV.

Furthermore, assuming your system voltage for the ACS722 and the ADC is 3.3V, following is the correct explanation: If you read 0.5 with the AnalogIn read function, it means half the supply voltage. With the ACS722 connected to the analog input it means 0A (zero amps). This sounds reasonable if no current is flowing.

LPC1768: ADC Programming - Tutorials

an ADC which converts the analog signal to a 12-bit digital value has a resolution of 12 bits. The smallest incremental voltage that can be recognized is expressed in terms of LSB. 1 LSB = (V_{REF} - V_{SS})/2ⁿ Where LSB = Least-significant bit

The resolution of the ADC is the smallest voltage that can be encoded digitally, in other words the voltage represented by one bit. This is given by $10 \div 255 \approx 0.04$ V. The different voltage levels that the outputs from the ADC represent must be coded appropriately within the digital circuit.

The NXP LPC1768 ADC has 8 multiplexed inputs. (See table below). All 8 inputs are alternate functions to the default digital input-output functions. Pins 98 (P0.2) and 99 (P0.3) are not available as external pins on the MBED board. Pins 20 (P1.31) and 21 (P1.30) are wired directly to potentiometers on the application board.
